

AIDS Cases in Adult/Adolescent Women, Reported July 1998 - June 1999, and Estimated AIDS Incidence,* Diagnosed July 1998 - June 1999, by Risk Exposure United States

* Data adjusted for reporting delays and estimated proportional redistribution of cases initially reported without risk. Data reported through March 2000.

AIDS Cases in Adult/Adolescent Women, Reported July 1998-June 1999, and Estimated AIDS Incidence, Diagnosed July 1998-June 1999, by Risk Exposure, United States

In the pie on the right, after data are adjusted for reporting delays and cases initially reported without risk exposure information are reclassified based on historical patterns of risk distribution, over one-third of AIDS cases in adult/adolescent women diagnosed from July 1998 through June 1999 were attributed to injection drug use. The majority of cases, 62%, were attributed to heterosexual contact. The other categories accounted for the remaining cases.
